HealthLink Inc. Transport Medium (UTM®) System

Instructions for use

INTENDED USE
HealthLink Inc. Transport Medium (UTM®) System is intended for collection and transport to the analysis laboratory of clinical specimens with suspected presence of viruses, chlamydiae, mycoplasmas or ureaplasmas for subsequent culture techniques.

SUMMARY AND PURPOSES
One of the routine procedures in the diagnosis of infections caused by viruses, chlamydiae, mycoplasmas or ureaplasmas involves collection and refrigerated transport of biological specimens. Using the UTM® System, the collected specimen can be stored for up to 48 hours at 2-25°C.

The UTM® consists of a Hank's Balanced Salt Solution (HBSS) enriched with proteins and sugars with a neutral pH and pH indicator. The medium contains some antibiotics and antifungicides to inhibit overgrowth of bacteria and yeasts, maintain cellular integrity and encourage preservation of viruses and chlamydiae if specimens are frozen at -70°C or colder until the time of processing.1,4,6

PRODUCT DESCRIPTION
UTM® System is ready for use and requires no further preparation. It is available in the various configurations listed in Table 1 and supplied in a labeled screw-cap test tube filled with different volumes of UTM®.

Table 1: product description

<tbody>
<tr>
<td>330C.DHI</td>
<td>3 ml of UTM® medium in 16x100 mm screw-cap tube with internal shaped conical bottom.</td>
<td>50 tubes per package 6 x 50 tubes per box</td>
</tr>
<tr>
<td>350C.DHI</td>
<td>1 ml of UTM® medium in 12x80 mm screw-cap tube with internal shaped conical bottom.</td>
<td>50 tubes per package 6 x 50 tubes per box</td>
</tr>
</tbody>
</table>

REAGENTS
The UTM® formulation includes proteins for virus stabilization, antibiotics and antifungicides to prevent overgrowth of bacterial and fungal flora and a buffer solution to maintain a neutral pH.

pH 7.3 ± 0.2 at 2-25°C

DISPOSAL
Waste must be disposed of in compliance with local legislation. Take the appropriate precautions for infected material if necessary.

QUALITY CONTROL
The UTM® System is tested to guarantee the absence of toxicity for the cellular lines used for the viral cultures and the ability to maintain the viability of viral, chlamydia and mycoplasma strains for up to 48 hours at 2-25°C in accordance with the methods described in CLSI M40-A2.5

RESULTS AND PERFORMANCE
The results obtained largely depend on proper and adequate specimen collection as well as the promptness with which the specimens are transported to the laboratory and analysed.

Viability studies were performed using UTM® with a panel of representative strains of the various families supported by the UTM®. The swabs that accompany each transport system were directly inoculated in triplicate with 100 µl of organism suspension. Subsequently, the swabs were inserted in the respective test tubes containing the transport medium and stored for 0 and 48 hours at 2-25°C. At the time of processing, each swab was vortexed for 20 seconds and removed from its transport medium test tube. At this point, an aliquot of the suspension was inoculated into the cellular line (200 µl) or into the appropriate culture medium. All the cultures were processed using the standard laboratory culture technique.1,2,3

Organ viability was determined by fluorescent cell counting for viral and chlamydia strains and CFU counting for mycoplasma strains. The acceptability limits for time zero and for 48 hours were defined in accordance with the regulations M40-A2.5

UTM® System preserved the viability of all the organisms tested for 48 hours at both controlled room temperature and in the refrigerator in the above described test conditions. The organisms evaluated and the results obtained are given in the table below.

NOTE: The HealthLink UTM® performance tests were conducted using laboratory strains and not human samples.

REQUIRED MATERIALS BUT NOT PROVIDED
Matters suitable for isolation, differentiation and culture of viruses, chlamydiae, mycoplasmas and ureaplasmas. The collection device is not provided in packaging in bulk.

STORAGE
The product must be stored in its original packaging at a temperature between 2 and 25°C until the time of use. Do not overheat or freeze prior to use.

LIMITATIONS
1. Because calcium alginate swabs are toxic for many enveloped viruses and may interfere with immunofluorescence tests, they should not be used for specimen collection.
2. Wooden shaft swabs may contain toxins and formaldehyde and should not be used.

WARNINGS AND PRECAUTIONS
2. Do not use beyond the expiry date.
3. Do not immerse the collection device in the UTM® test tube before sampling.
4. Specimens for the search of viruses, chlamydiae, mycoplasmas and ureaplasmas must be collected and handled using personal protective equipment against biological risk according to published manuals and guidelines.
5. Repeated freezing and thawing of specimens may reduce the recovery of viable organisms.
6. Identify the test tube containing the specimen.
7. Do not use if the device shows visible signs of damage or contamination. If you observe medium leaking from the test tube or if the medium appears murky yellow.
8. Do not use if the product in combination with diagnostic kits or instruments must be validated by the user prior to use.

INSTRUCTIONS FOR USE
Proper collection of the specimen from the patient (e.g. aspirates, small tissue or faecal specimens, urine) is a crucial aspect for successful isolation and identification of infectious organisms. In order to maintain optimal microorganism viability, transport the specimens to the laboratory as soon as possible considering that the viral concentrations reach the maximum values during the acute phase of the disease.

UTM® in bulk
1. After collecting the specimen, unscrew and remove the cap from the UTM® test tube taking care not to spill the medium.
2. Insert the previously validated swab into the test tube until the breakpoint (if present) is level with the test tube opening.
3. Blend and break the swab at the breakpoint holding the test tube away from your face: should the swab used not have a breakpoint, cut the excess part of the shaft and discard it.
4. Screw the cap back onto the test tube and hermetically seal it.
5. Process the specimen contained in the UTM® within 48 hours from collection storing the test tube at 2-25°C.
6. Before processing, vortex for 20 seconds in order to encourage specimen release from the swab and homogenize the medium.

If processing is delayed (over 48 hours), the specimens must be frozen at -70°C or colder.

3. Do not immerse the collection device in the UTM® test tube and discard it.
4. Screw the cap back onto the test tube and hermetically seal it.
5. Repeated freezing and thawing of specimens may reduce the recovery of viable organisms.
6. Identify the test tube containing the specimen.
7. Do not use if the device shows visible signs of damage or contamination. If you observe medium leaking from the test tube or if the medium appears murky yellow.
8. Do not use if the product in combination with diagnostic kits or instruments must be validated by the user prior to use.
