A Simple 4-Step Process to Aid in the Diagnosis of Adenoviral Conjunctivitis

**Important**
- AdenoPlus should be performed PRIOR to instilling ocular anesthetic or topical medication. If topical medication has been used, wait at least 5 minutes before collecting a sample.
- Once opened, the Test Cassette should be used within 1 hour.

**Tips for success with AdenoPlus**

**Collecting the sample**

**A** Instruct the patient to look up.
**B** Gently lower the eyelid to expose the palpebral conjunctiva.
**C** Dab the sampling fleece in multiple locations along the conjunctiva, releasing the lid after every 2-3 dabs.
**D** Allow the patient to blink.
**E** After completing a minimum of 6-8 dabs along the conjunctiva, allow the sampling fleece to rest on the conjunctiva for an additional 5 seconds, to ensure saturation.
**F** Inspect the sampling fleece. The fleece will glisten when an adequate tear sample is collected. Depending on the patient’s tear composition, the fleece may also turn patchy pink in color. If the fleece is NOT glistening, repeat the entire process.

Refer to the Package Insert for AdenoPlus found on the AdenoPlus product page under Product Documentation at: quidel.com/AdenoPlus

**Reading the results**
- Wait a minimum of 10 minutes before reading test results.
- If the test is negative after 10 minutes, allow an additional 5-10 minutes before reading test results.
- Read any form of a red line, whether faint, broken, or shadow, as a positive test result.
