Intended Use:
For Training use.
The Herpes simplex Virus (HSV) panel is comprised of 24 frozen 1-mL liquid aliquots. Six of these aliquots have been tested and confirmed to contain viable clinical isolates of Herpes simplex virus type 1. An additional six have been tested and confirmed to contain viable clinical isolates of Herpes simplex virus type 2. The remaining twelve aliquots have been tested and confirmed as negative for the presence of Herpes simplex virus. The panel has been designed for use with cell culture. The validation of this panel with non-cell culture systems is the responsibility of the end-user.

Principle:
Twelve HSV viruses have been propagated in cell culture, diluted and frozen at -70°C. The actual titer in each aliquot is unknown, and has not been quantitatively assayed. Inoculation of this panel should be performed as described in the Product Insert or Instructions for Use of the system in which it will be used.

Storage and handling instructions:
It is recommended that the panel be stored at -70°C or lower. Once the panel has been thawed it should not be re-frozen.

Warnings and Precautions:
1. Personnel working with this panel must be properly trained in virus culture and safe handling techniques.1
2. Manipulations which present potential personnel hazards should be conducted in a Class II hood with gloves worn at all times and in accordance with the guidelines presented in the CDC-NIH Manual.

Virus Handling and Usage Instructions:
1. The HSV panel should be transferred from the shipping container to a -70°C or lower freezer immediately upon receipt.
2. At the time of use, rapidly thaw the panel aliquots in a 35° to 37°C water bath.
3. Vortex the aliquots for 10-seconds prior to use.
4. Inoculate the panel aliquots without further dilutions. (200-µL is the recommended volume for inoculation)
